ADDITIONAL MATERIALS

In addition to this question paper, you will need the Resource Folder and one pink WJEC 20 page answer book, which has been specifically designed for this examination. No other style of answer book should be used. Should you run out of space, use a standard 4 page continuation book.

INSTRUCTIONS TO CANDIDATES

Use black ink or black ball-point pen or your usual method. Do not use gel pen or correction fluid.

Answer ALL questions.

Write your answers in the separate answer book provided, following the instructions on the front of the answer book.
INFORMATION FOR CANDIDATES

The number of marks is given in brackets at the end of each question or part-question.

You are reminded that assessment will take into account the quality of written communication used in your answers.

You are reminded that this paper is synoptic and so will assess your ability to draw on your understanding of the connections between the different aspects of the subject represented in the Geography specification.

Even where not specifically asked for, you should support your answer with examples and/or case studies.
Answer ALL questions.

SECTION A

In this section you may use information from the
RESOURCE FOLDER and your own research.

01 Describe variations in the growth rates of cities
throughout the world. [10]
(approximately 13 minutes)

02 Outline problems associated with the supply of
energy. [10]
(approximately 13 minutes)

03 Outline the advantages of TWO alternative
sources of energy. [10]
(approximately 13 minutes)

04 ‘The growth of cities inevitably causes an increase
in energy use.’
Assess how far this is true and its implications for
sustainability. [25]
(approximately 33 minutes)
SECTION B

In this section you may use information from any of your studies for AS and A2 Geography as well as from the Resource Folder and your own research.

05 Describe ways in which physical factors can limit food production. How far can technological developments overcome these limitations and ensure a sustainable supply of food? [25]

(approximately 33 minutes)

END OF PAPER
Pre-Release Material for examination on 16 June 2016.

To be opened on receipt.

A new copy of this Folder will be given out in the examination.
INSTRUCTIONS TO CANDIDATES

A new copy of this Folder will be given out in the examination. This copy must not be taken into the examination.

Work through this Folder to make sure you understand all the resources. You may seek help from your teachers or any other sources in this context. You have to apply your critical understanding to an unfamiliar situation.

ADVICE TO CANDIDATES

The materials in this Folder provide information on cities, their growth, their use of energy, and on supplies of energy that can be used in cities.
GUIDELINES FOR USING THE PRE-RELEASE MATERIALS

The contents of the booklet should be studied carefully. The examples given will help in answering some of the questions on the question paper. To give a fuller answer, it is advisable to look at other material before the examination. This could be similar topics, related to information in other countries, or may be the same countries but in greater depth or on closely related topics. It would be particularly useful to note if other case studies seem similar in nature, or if they show contrasting perspectives to those from the material in this Resource Folder.

Some of the resource materials come from Geography textbooks, but others come from companies, pressure groups, research organisations, governments and private individuals. In some cases they are using information to promote their own interests rather than to represent an impartial view. It is worth considering if they are trying to support a particular interest group and persuade readers to agree with them. In finding other materials, it is worth bearing in mind that they might not be presented in an impartial and objective way.

Material in the Resource Folder may often be related to other themes found in G4, and to other units in Geography AS and A2. These links should be noted, as there will be opportunities to refer to such connections with other work in some of your answers. Being able to link together different parts of your Geography studies is important and will be credited. Such linkages are sometimes referred to as ‘synopticity’.
Textbooks, journals, good quality newspapers and television and radio programmes are good sources of information. Probably the most accessible source of geographical information is the Internet, but it is also the one which may be most susceptible to bias and lack of impartiality. Many of the resources are extracted or adapted from sources on the Internet. These sources have the web addresses provided only for copyright reasons. Many are only extracts or shortened versions of fuller documents and some may be inaccessible by the date of the release of this Resource Folder. Following some of these links for greater depth of reading and for more recent updates of material can be helpful but is not essential. It is NOT the intention that by providing these web addresses every one listed is researched.

Each candidate will be provided with a copy of the Resource Folder, for use in the examination, at the same time as the question paper is issued at the beginning of the examination on the day set for the paper.

Copies of the Resource Folder with added notes, or notes from research carried out in the previous six weeks, may not be taken into the examination.

FIGURE 9: RELATIONSHIP BETWEEN TEMPERATURE AND ENERGY CONSUMPTION IN SUPERMARKETS IN THREE CITIES IN THE USA

Source: adapted from earthgauge.net
Residential energy demand can be gauged by DEGREE-DAYS. A degree-day is the difference between a day’s average temperature and 65°F (65°F = 18°C).

HEATING DEGREE-DAYS (HDDS) are measured when the temperature is below 65°F. For example, if the day’s average temperature was 55°F, the HDD would equal 10° (65° – 55° = 10°). A 30-day month of similar conditions would mean HDD equals 300°.

COOLING DEGREE-DAYS (CDDS) work the same way, but are for temperatures over 65°F. An average temperature of 75°F would mean CDD equals 10°.

Source: adapted from earthgauge.net
FIGURE 11: VARIATIONS IN HEATING AND COOLING REQUIREMENTS IN MAINLAND USA, 1960–2010

CLIMATE ZONES
- Zone 1 is less than 2,000 CDD and greater than 7,000 HDD
- Zone 2 is less than 2,000 CDD and between 5,500 and 7,000 HDD
- Zone 3 is less than 2,000 CDD and between 4,000 and 5,499 HDD
- Zone 4 is less than 2,000 CDD and less than 4,000 HDD
- Zone 5 is 2,000 CDD or more and less than 4,000 HDD

Source: earthgauge.net
FIGURE 12: PREDICTED CHANGES IN HEATING AND COOLING DEGREE-DAYS FOR SELECTED CITIES BY 2080

The estimates above are based on an expectation of a rise in temperature from climate change. It shows two predictions, one where increases in emissions are lower than in the past, and one where emissions increase at higher rates.

FIGURE 22: PRODUCTION OF SOLAR PHOTOVOLTAIC (PV) ENERGY

Energy source:
Sunlight sends as much as 1,000 watts per square metre of energy to the Earth’s surface

Energy conversion:
PV cells capture sunlight

Energy inversion and conditioning:
The energy is converted to electricity

Energy use:
Electricity can be used for lighting and other purposes

Energy distribution:
Excess electricity can be stored for future use or sold to utilities

Energy storage:
Electricity is sent to batteries to power a building

Sold to power utilities
